1 Literature Review

In this first assignment we try to combine basic principles from game theory with the work concerning multi-agent reinforcement learning. Most literature included in this literature review will therefore more of less fall into one of these categories. First we give an overview of the relevant literature. Afterwards, we give a detailed list of the contributions for each paper.

Shoham and Leyton-Brown [6] introduces elementary concepts from game theory. Bloembergen [1] introduces basic concepts from multi-agent systems, and explains how reinforcement learning algorithms can be used to reach equilibriums in simple games. Replicator dynamics are introduced to model evolutionary concepts in multi-agent systems. Bloembergen [1] also introduces lenient reinforcement learning to overcome difficulties when bad initial exploration leads to convergence to wrong equilibria.

We use the game-theoretic reinforcement learning framework OpenSpiel for all experiments. The practical details are outlined in Lanctot et al. [4]. Details about solving the Prisoner's Dilemma using reinforcement learning algorithms are found in Harper et al. [3].

To implement the Lenient Frequency Adjusted Q-Learning, we used Bloembergen et al. [2] and Tuyls et al. [7].

Article	Contribution
Multi-agent systems: Algorithmic, Game-Theoretic,and Logical Foundations, Shoham and Leyton-Brown [6]	Game theory (utility, payoff functions, strategies, zero-sum games, Pareto optimality, Nash equilibria, existence of Nash equilibria), Finding Nash equilibria (minmax and maxmin algorithms)
Multi-agent learning dynamics, Bloembergen [1]	Multi-agent systems as a way to solve many problems using sensor data as input and rewards as output, evolutionary modelling (replicator dynamics as selection strategy)
OpenSpiel: A Framework for Reinforcement Learning in Games, Lanctot et al. [4]	The OpenSpiel framework: installation, design, implemented games and algorithms, visualization
Reinforcement learning produces dominant strategies for the Iterated Prisoner's Dilemma, Harper et al. [3]	Definition of Prisoner's dilemma, example values for parameter tuning (learning rate, discount factor)
The replicator equation on graphs, Ohtsuki and Nowak [5]	Phase plots as a visual representation of graphing evolutionary policies by using replicator dynamics.
Analyzing Reinforcement Learning algorithmsusing Evolutionary Game Theory, citetbloembergenmaster	Recommended parameter settings for various Q learning algorithms (learning rate, epsilon, step size, etc.)
Evolutionary Dynamics of Multi-Agent Learning:A Survey, Bloembergen et al. [2]	Mathematical formulation of lenient FAQ-Learning to increase the robustness of regular Q-learning
Extended Replicator Dynamics as a Key to Reinforcement Learning in Multi-agent Systems, citetextrepl	Extension of classical replicator dynamics by adding mutation, in accordance to Boltzmann dynamics, leniency as a way to overcome convergence to wrong equilibria.
